

Counting duplicate strings

ClrMD – Lab 2

The goal of this workshop is to count duplicate strings

1. Use the same dump as Lab 1 and your previous application code or the available startup project to bootstrap the C# project
2. Write the code to list all objects and in case of an instance of a string type, count the number of duplicated strings
 1. Use a dictionary of `<string, int>` to count the string values
 2. Order the result by size of duplicated strings (i.e. $2 \times \text{length} \times \text{count}$)
